Introduction

In Digital Network Architecture Controller (DNAC) Software defined Access (SD-Access) solution, devices are managed and configured by a DNAC. But there is a part of the topology which has to be manually configured, as components with the role of Fusion Routers are not managed by DNAC. This article provides detailed steps for configuring the Fusion Routers, which helps achieve Virtual routing and forwarding (VRF) leaking across SD-Access Fabric domains, and host connectivity to different external servers (Dynamic Host configuration Protocol or DHCP and others).

Why the DNA-SDA solution requires Fusion router?

Today the Digital Network Architecture Software Defined Access (DNA-SDA) solution requires a fusion router to perform VRF route leaking between user VRFs and Shared-Services, which may be in the Global routing table (GRT) or another VRF. Shared Services may consist of DHCP, Domain Name System (DNS), Network Time Protocol (NTP), Wireless LAN Controller (WLC), Identity Services Engine (ISE), DNAC components which must be made available to other virtual networks (VN's) in the Campus. Thus by creating Border Gateway Protocol (BGP) peerings from the Border Routers to the Fusion Routers, on the Fusion Router the fabric VRF's subnets which need access to these shared services will be leaked into GRT, and vice-versa. Route maps can be used to help contain routing tables to subnets specific to SDA Fabric.

Note:

This article is based on DNAC version 1.2.1. In the future, with the introduction of the "LISP Extranet"(Location Identifier Separation Protocol) feature, dependency on Fusion Router will be reduced.

Prerequisites

Requirements

Setup is required as per "Supported devices for SDA" which can be found at: [Link to release notes](#)

Components Used

Devices used for this Article

DNAC - Version 1.2.1

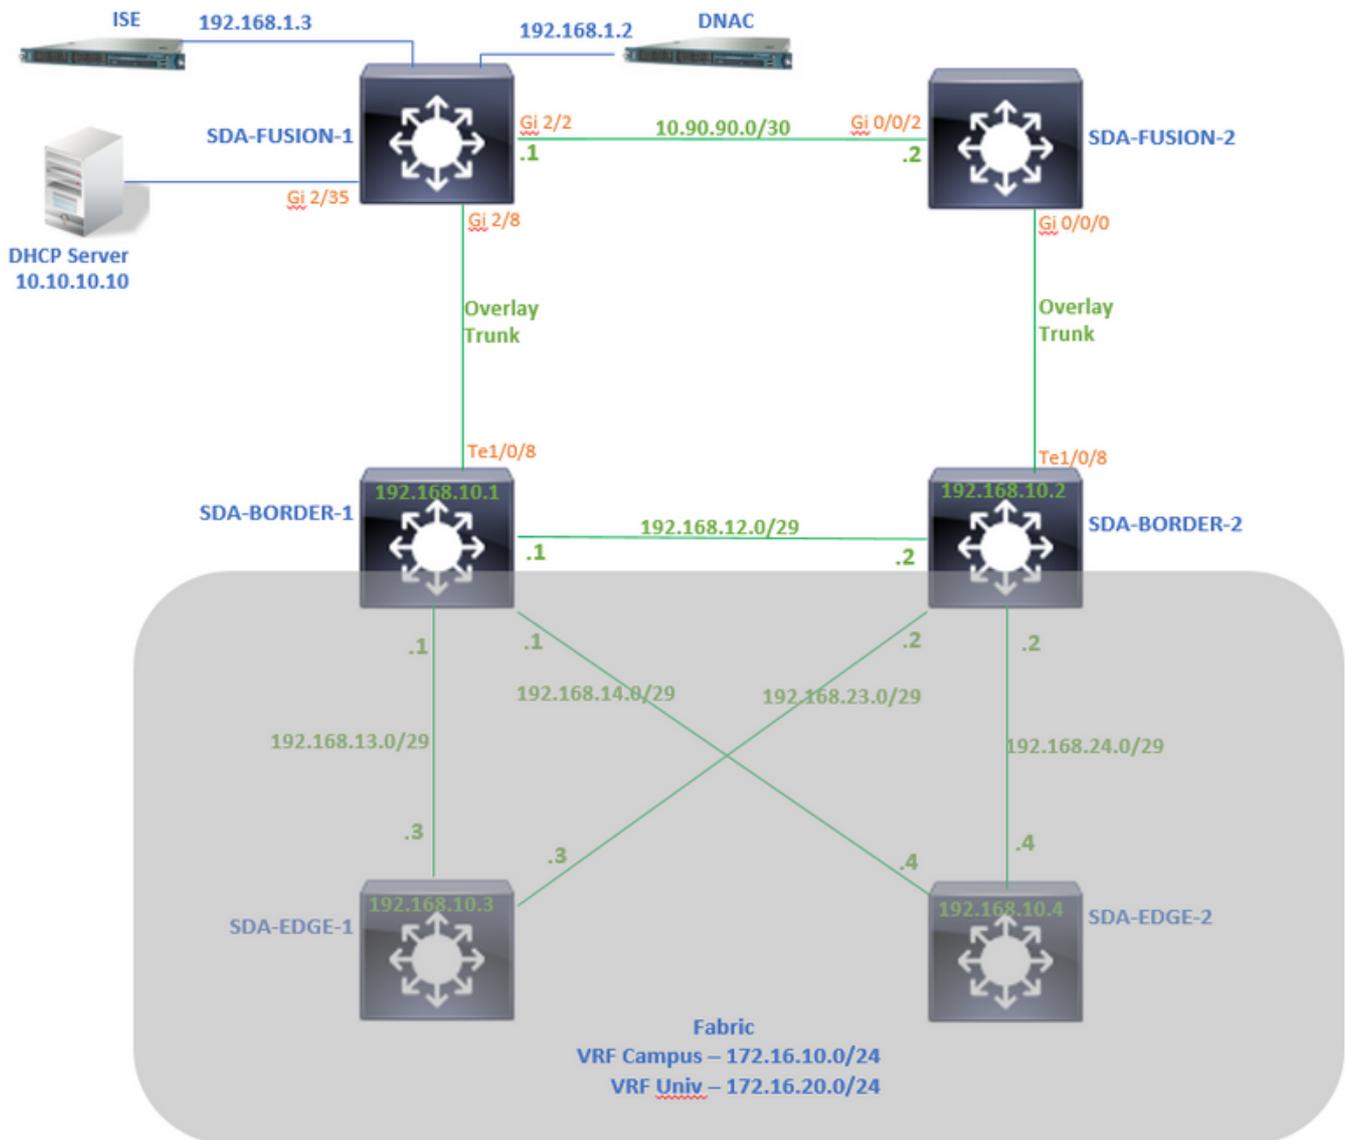

Edge and Border - Cat3k Cisco Switch

Fusion - Cisco Router with Support for Inter-VRF leaking

Configuration

Network Diagram

Topology used for this article consists of two Border Routers both configured as External Borders, and two Fusion Routers with a connection to each respective Border Router.

Configurations

Step1: Configuring Hand-off link from DNAC

During the step of assigning devices a role of Border Router while adding to the Fabric, hand-off link can be added.

At layer 2 this will be a trunk link connected to the Fusion Router. Following steps are needed:

- Configure Local AS Number for BGP. This Autonomous System (AS) number will be used to configure the BGP process on the Border Routers.
- Add interface under Transit. This interface is the direct connection between Border and Fusion Router. (Te 1/0/8 on Border in this example)

SDA-Border1

Border to

- Rest of Company (Internal)
- Outside World (External)
- Anywhere (Internal & External)

Local Autonomous Number

Connected to the Internet

Transit

Add

ABC

External Interface

Add Interface

Interface

Number of VN

TenGigabitEthernet1/0/8

2

- Configure Remote AS Number. This AS Number will be used on Border Routers for neighbor statements towards Fusion Router to configure External BGP (eBGP) peering.

- Select all the Virtual Networks (VRFs) for which VRF leaking is required on Fusion Router.

- Deploy configuration from DNAC to Devices.

address-family ! address-family ipv4 vrf Univ bgp aggregate-timer 0 network 172.16.20.1 mask
255.255.255.255 aggregate-address 172.16.20.0 255.255.255.0 summary-only redistribute lisp
metric 10 neighbor 10.50.50.10 remote-as 65004 neighbor 10.50.50.10 update-source Vlan3003
neighbor 10.50.50.10 activate neighbor 10.50.50.10 weight 65535 exit-address-family
```

Step3: Configure "allowas-in" on Border Routers

As per VRF leaking on Fusion Router, address-family ipv4 for VRF Campus will learn routes originated by VRF Univ (172.16.20.0/24). But both originating and learning router have the same BGP AS number (65005). To Overcome BGP loop prevention mechanism and accept/install the routes on Border Routers, "allowas-in" must be configured for the peerings with the Fusion Router:

```
SDA-Border1
```

```
SDA-Border1(config)# router bgp 65005
SDA-Border1(config-router)# address-family ipv4 vrf Campus
SDA-Border1(config-router-af)# neighbor 10.50.50.26 allowas-in
SDA-Border1(config-router-af)# exit-address-family
SDA-Border1(config-router)#
SDA-Border1(config-router)# address-family ipv4 vrf Univ
SDA-Border1(config-router-af)# neighbor 10.50.50.22 allowas-in
SDA-Border1(config-router-af)# exit-address-family
```

```
SDA-Border1(config-router)#
```

```
SDA-Border2
```

```
SDA-Border2(config)#router bgp 65005
SDA-Border2(config-router)# address-family ipv4 vrf Campus
SDA-Border2(config-router-af)# neighbor 10.50.50.2 allowas-in
SDA-Border2(config-router-af)# exit-address-family
SDA-Border2(config-router)#
SDA-Border2(config-router)# address-family ipv4 vrf Univ
SDA-Border2(config-router-af)# neighbor 10.50.50.10 allowas-in
SDA-Border2(config-router-af)# exit-address-family
SDA-Border2(config-router)#
```

Step4: Configure Fusion Routers

This Section will show all the configuration needed on Fusion routers which are configured manually.

```
SDA-Fusion-1
```

Configure link towards Border Router as trunk

```
interface GigabitEthernet2/8
 switchport
 switchport trunk encapsulation dot1q
 switchport trunk allowed vlan 3006, 3007
 switchport mode trunk
end
```

Configure corresponding VRF-s

```
vrf definition Campus
 rd 1:4099
 !
 address-family ipv4
 route-target export 1:4099
 route-target import 1:4099
 exit-address-family
 !
```

```
vrf definition Univ
 rd 1:4100
 !
 address-family ipv4
 route-target export 1:4100
 route-target import 1:4100
 exit-address-family
```

Configure SVI interfaces

```
interface Vlan3007
  vrf forwarding Campus
  ip address 10.50.50.26 255.255.255.252
end
```

```
interface Vlan3006
  vrf forwarding Univ
  ip address 10.50.50.22 255.255.255.252
end
```

Configure eBGP Peering with SDA-Border-1

```
router bgp 65004                                     <<< Remote AS from DNAC
  bgp log-neighbor-changes
  !
  address-family ipv4
  exit-address-family
  !
  address-family ipv4 vrf Campus
    neighbor 10.50.50.25 remote-as 65005
    neighbor 10.50.50.25 update-source Vlan3007
    neighbor 10.50.50.25 activate
  exit-address-family
  !
  address-family ipv4 vrf Univ
    neighbor 10.50.50.21 remote-as 65005
    neighbor 10.50.50.21 update-source Vlan3006
    neighbor 10.50.50.21 activate
  exit-address-family
```

Configure Internal BGP (iBGP) Peering with SDA-Fusion-2

```
interface GigabitEthernet2/2
  description SDA-Fusion1--->SDA-Fusion2
  ip address 10.90.90.1 255.255.255.252
end
```

```
router bgp 65004
  neighbor 10.90.90.2 remote-as 65004
  !
  address-family ipv4
    neighbor 10.90.90.2 activate
  exit-address-family
  !
```

Advertise DHCP Server Pool Under Global Address-Family

DHCP Server IP - 10.10.10.10

```
interface GigabitEthernet2/35
  description connection to DHCP server
  ip address 10.10.10.9 255.255.255.252
end
```

```
router bgp 65004
  !
```

```
address-family ipv4
  network 10.10.10.8 mask 255.255.255.252
exit-address-family
!
```

SDA-Fusion-2

Configure link towards Border Router. If an interface on Fusion is L3 instead of trunk - configure subinterfaces.

```
interface GigabitEthernet0/0/0.3001
  encapsulation dot1Q 3001
  vrf forwarding Campus
  ip address 10.50.50.2 255.255.255.252
end
```

```
interface GigabitEthernet0/0/0.3003
  encapsulation dot1Q 3003
  vrf forwarding Univ
  ip address 10.50.50.10 255.255.255.252
end
```

Configure corresponding VRFs

```
vrf definition Campus
  rd 1:4099
  !
  address-family ipv4
    route-target export 1:4099
    route-target import 1:4099
  exit-address-family
!
!
vrf definition Univ
  rd 1:4100
  !
  address-family ipv4
    route-target export 1:4100
    route-target import 1:4100
  exit-address-family
!
```

Configure eBGP Peering with SDA-Border-2

```
router bgp 65004
  bgp log-neighbor-changes
  !
  address-family ipv4
  exit-address-family
  !
  address-family ipv4 vrf Campus
    neighbor 10.50.50.1 remote-as 65005
    neighbor 10.50.50.1 update-source GigabitEthernet0/0/0.3001
    neighbor 10.50.50.1 activate
  exit-address-family
  !
  address-family ipv4 vrf Univ
    neighbor 10.50.50.9 remote-as 65005
    neighbor 10.50.50.9 update-source GigabitEthernet0/0/0.3003
```

```
neighbor 10.50.50.9 activate
exit-address-family
```

Configure iBGP Peering with SDA-Fusion-1

```
interface GigabitEthernet0/0/2
ip address 10.90.90.2 255.255.255.252
negotiation auto
end
```

```
router bgp 65004 neighbor 10.90.90.1 remote-as 65004 ! address-family ipv4 neighbor 10.90.90.1
activate exit-address-family
```

Step5: Configure VRF Leaking on Fusion Router

Configuration for VRF leaking is identical for both Fusion Routers SDA-Fusion-1 and SDA-Fusion-2

At first configure VRF leaking between two VRFs - Campus and Univ - using "route-target import"

```
vrf definition Campus
!
address-family ipv4
route-target export 1:4099
route-target import 1:4099
route-target import 1:4100 <<< Import VRF Univ prefixes in VRF Campus
exit-address-family
!
vrf definition Univ
!
address-family ipv4
route-target export 1:4100
route-target import 1:4100
route-target import 1:4099 <<< Import VRF Campus prefixes in VRF Univ
exit-address-family
!
```

Then configure route leaking between Global Routing Table to VRFs and VRFs to Global Routing Table using Import-map and export-map.

```
ip prefix-list Campus_Prefix seq 5 permit 172.16.10.0/24 <<< Include Prefixes belonging to
VRF Campus
ip prefix-list Global_Prefix seq 5 permit 10.10.10.8/30 <<< Include Prefixes belonging to
Global (eq DHCP Server Subnet)
ip prefix-list Univ_Prefix seq 5 permit 172.16.20.0/24 <<< Include Prefixes belonging to
VRF Univ
```

```
route-map Univ_Map permit 10
match ip address prefix-list Univ_Prefix
route-map Global_Map permit 10
match ip address prefix-list Global_Prefix
route-map Campus_Map permit 10
match ip address prefix-list Campus_Prefix
```

```

vrf definition Campus
!
address-family ipv4
import ipv4 unicast map Global_Map <<< Injecting Global into VRF Campus matching route-map
Global_Map
export ipv4 unicast map Campus_Map <<< Injecting VRF Campus into Global matching route-map
Campus_Map
exit-address-family
!
vrf definition Univ
!
address-family ipv4
import ipv4 unicast map Global_Map <<< Injecting Global into VRF Univ matching route-map
Global_Map
export ipv4 unicast map Univ_Map <<< Injecting VRF Univ into Global matching route-map Univ_Map
exit-address-family
!

```

Verify

This Section contains Verification steps to ensure configuration done as part of previous section has taken effect correctly.

Step1: Verify eBGP Peering Between Fusion and Border Routers

SDA-Border-1 -----Peering-----SDA-Fusion-1

```
SDA-Border1#sh ip bgp vpnv4 vrf Campus summary
```

Neighbor	V	AS	MsgRcvd	MsgSent	TblVer	InQ	OutQ	Up/Down	State/PfxRcd

```

Step2: Verify iBGP Peering Between both Fusion Routers

SDA-Fusion-1 -----Peering-----SDA-Fusion-2

```
SDA-Fusion1#sh ip bgp summary
```

```
Neighbor      V      AS MsgRcvd MsgSent  TblVer  InQ  OutQ  Up/Down  State/PfxRcd
10.90.90.2    4      65004      10     12     12     0     0 00:04:57      2
```

```
SDA-Fusion2#sh ip bgp summary
```

```
Neighbor      V      AS MsgRcvd MsgSent  TblVer  InQ  OutQ  Up/Down  State/PfxRcd
10.90.90.1    4      65004      19     17     4     0     0 00:11:35      3
```

Step3: Verify Prefixes in BGP table and Routing Table

Device: SDA-Border-1

```
SDA-Border1#sh ip bgp vpnv4 vrf Campus
```

```
Network      Next Hop      Metric LocPrf Weight Path
Route Distinguisher: 1:4099 (default for vrf Campus)
*> 10.10.10.8/30 10.50.50.26      65535 65004 i      <<< Prefix
